Wnode Ltd

Business Plan

Author:Stephen Soos - Founder

1. Executive Summary

WeNode (WNODE) has built (MVP) an AI powered Planetary Compute Mesh, a truly vertically integrated and sovereign, AI-native decentralised network that turns the world's idle hardware into a powerful, accessible, and unstoppable alternative to hyperscale cloud empires and crypto native Depin's.

WeNode intelligently aggregates untapped compute from consumer devices, enterprise fleets (Cars), edge IoT, and tomorrow's connected machines (Robots) into one unified, high-performance mesh. Powered by our proprietary recursive AI orchestration model, the network dynamically routes, optimises, and verifies workloads in real time, delivering high performance whilst dramatically lowering costs and avoiding the environmental impact of giant data centres.

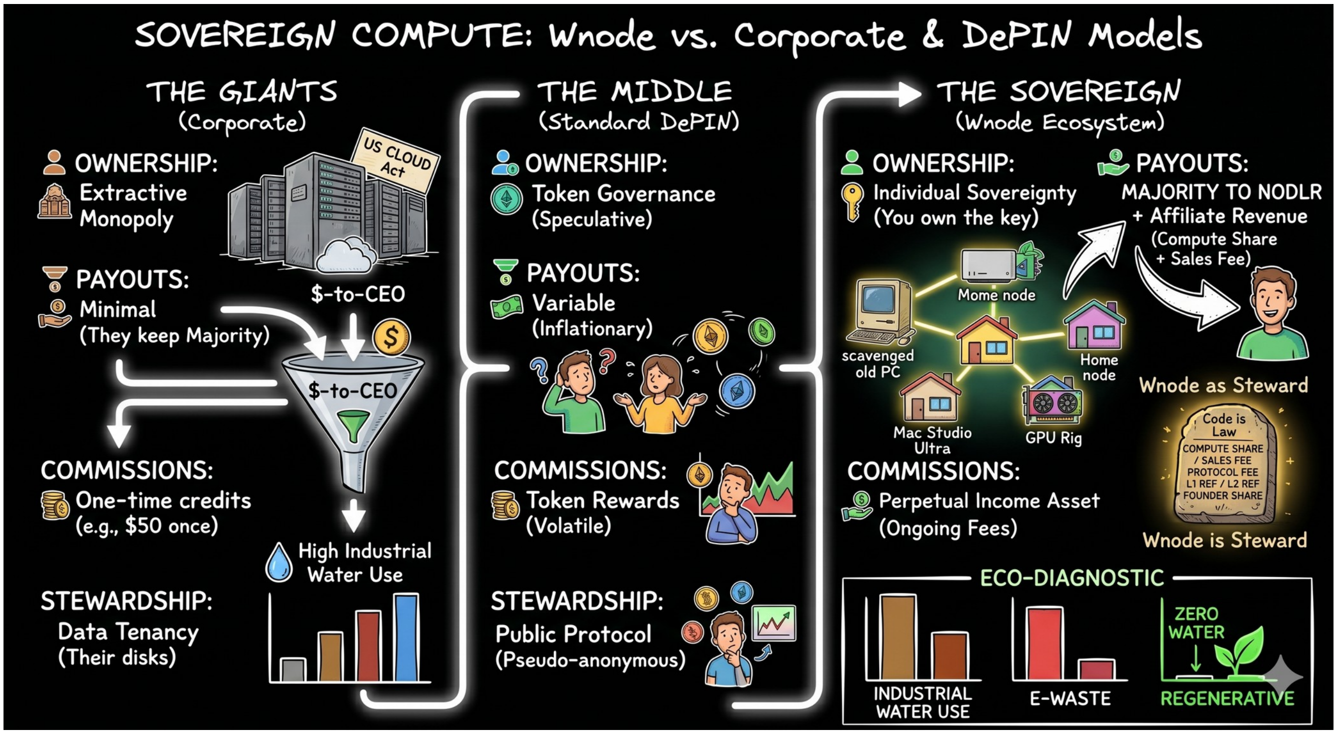
Why Now?
AI compute demand is exploding. Worldwide AI spending is forecast to hit $2.5 trillion in 2026, yet centralized data centers cannot scale fast enough. Traditional servers run at shockingly low utilisation, often just 10-20%, while millions sit completely idle, wasting energy and capital.

WeNode flips the script and instead of burning resources on new mega data centers, we activate existing hardware at global scale. We sit at the perfect intersection of the AI boom and the DePIN revolution, a sector projected to grow from tens of billions today to $3.5 trillion by 2028.

Hybrid Fiat/Crypto Engine
Unlike many speculative plays, WeNode is a true hybrid infrastructure business where compute buyers pay in stable fiat for reliable compute, generating real revenue and delivering the majority share directly to node operators in USD. The **WEX** token powers incentives, staking, performance boosts, and network growth, creating strong tokenomics-driven upside for holders and participants.

Standout Advantages:

- Anyone, Anywhere: Become a node operator in just 3 clicks, dead simple onboarding that opens the network to millions
- Payments accepted and distributed in USD by Stripe
- True Community Ownership: Whale-proof and Sybil-resistant governance with gold-standard design that puts real power in the hands of participants.
- Kind to the Planet: Monetizes idle resources instead of building new energy-intensive infrastructure, one of the greenest compute models on earth.
- Viral Growth Engine: Powerful affiliate system with generous bi-level rewards that turns every node operator into a motivated salesperson, driving supply at near-zero customer acquisition cost.
- Vertical Integration & Sovereignty: Full control over critical layers for maximum resilience and censorship resistance.



Exclusive Founder Affiliate Slots

Only 10 Founder Slots exist in total. Six are reserved for targeted global partners with massive untapped compute resources and reach. Up to 3 high-value slots remain available for strategic investors who want early positioning and active participation in a network designed to challenge hyperscalers, and even disrupt emerging models like Tesla's plans to sell compute from idle vehicles and robots.

WeNode is unlike other DePIN's. It is a defensible, hybrid Web4 infrastructure business built for explosive adoption, real utility, and asymmetric upside through network effects and sophisticated tokenomics.

This is the mesh that puts compute power back where it belongs, in the hands of the many.

2. The Problem

The centralised cloud model is cracking under the weight of the AI revolution, and the cracks are turning into chasms.

a. Explosive Demand Meets Structural Failure

AI workloads are growing at breakneck speed. Global AI infrastructure spending is surging, with data center capacity for AI expected to more than double in key markets by 2031. Yet hyperscalers and traditional providers simply cannot build new facilities fast enough. Power grid constraints, real estate shortages, and skyrocketing construction costs are creating severe capacity bottlenecks that are already delaying projects and driving up prices.

b. Monopoly Power and Systemic Fragility

A handful of hyperscalers now control the majority of high-performance compute. This creates artificial scarcity, vendor lock-in, unpredictable pricing, and dangerous single points of failure. Enterprises and developers are increasingly exposed to censorship risk, regional outages, and geopolitical vulnerabilities in an era where sovereign, resilient intelligence infrastructure is becoming a strategic necessity.

c. Massive Inefficiency and Environmental Cost

Traditional data centers are shockingly wasteful. Average server utilization hovers between 12-18%, with many servers running at just 10-15% while still consuming 50-80% of peak power even when idle. Millions of servers worldwide sit completely dormant, representing tens of billions in wasted capital and enormous energy waste.

McKinsey, NRDC, and multiple reports frequently reference 12-18% average utilization

This inefficiency comes with a heavy environmental toll. The rapid buildout of new AI data centers is driving massive increases in electricity demand, carbon emissions (projected 24-44 million metric tons CO_2 annually by 2030 in some scenarios), and water consumption for cooling.

Recent LBNL data shows idle power for conventional servers around 27-36% in newer models, but older fleets and many enterprise servers are still higher.

d. The Core Opportunity

While hyperscalers race to pour concrete and fight for power grids, vast amounts of compute capacity already exist , sitting idle in consumer devices, enterprise fleets, Cars/Ev's, IoT networks, and edge hardware around the planet. The current system leaves this potential untapped and disconnected.

This is not sustainable. The world needs a better way that is more accessible, more efficient, more sovereign, and fundamentally more aligned with the scale of AI demand.

3. The WeNode Solution

WeNode solves these massive inefficiencies by building the AI Orchestrated Planetary Compute Mesh, a sovereign, AI-orchestrated decentralised network that turns the world's idle hardware into a unified, high-performance, enterprise-grade compute layer.

Instead of pouring trillions into new power-hungry data centers, WeNode intelligently aggregates existing underutilised compute from consumer devices, enterprise fleets, IoT networks, edge hardware, and tomorrow's connected machines.

a. Core Differentiators:

- Proprietary AI Orchestration Layer Our self-owned recursive AI model (In training) dynamically routes, optimises, and verifies workloads in real time based on latency, hardware capability, cost, trust scoring, and energy efficiency. This intelligent layer delivers superior efficiency and reliability compared to traditional centralised systems.

- Sovereignty & Vertical Integration: WeNode maintains full control over critical coordination infrastructure, security layers, and key operations. This vertical integration minimizes third-party dependency, enhances censorship resistance, and delivers true user and operator sovereignty over their compute and data.

- Radical Accessibility Anyone can become a node operator in just 3 clicks. Simple, intuitive onboarding using WASM, desktop, or edge clients removes technical barriers and opens participation to millions of everyday users and businesses.

- Green by Design By activating idle hardware instead of building new facilities, WeNode offers one of the most environmentally responsible compute models available. It dramatically reduces the need for additional energy-intensive data centers and cooling infrastructure and reduces the huge impact of old tech landfill.

- True Decentralisation & Community Ownership Built with whale-proof and Sybil-resistant mechanisms, WeNode delivers gold-standard governance that puts real power in the hands of the community. No single entity can capture or control the network.

- Powerful Viral Growth Engine A built-in affiliate system with multiple FIAT revenue streams and Tokenomic rewards turns every node operator into a motivated growth partner. Participants earn from the hardware they bring online, creating a self-reinforcing flywheel that scales supply at near-zero traditional customer acquisition and hardware cost.

b. Hybrid Fiat/Crypto Economic Model

WeNode is engineered as a real infrastructure business. Compute buyers pay in stable fiat for reliable, high-performance compute. Node operators receive the majority share of revenue in fiat, providing sustainable immediate real-world income. The **WEX** token powers staking, incentives, performance bonuses, and network participation, driving strong tokenomics upside without relying on dividends or unsustainable yields.

WeNode is not another speculative DePIN experiment. It is a defensible, vertically integrated Web4 infrastructure platform designed to deliver better economics, greater resilience, and broader access than legacy hyperscalers, while creating meaningful upside for participants and early supporters.

4. Market Opportunity

WeNode is perfectly positioned at the explosive intersection of the AI compute supercycle and the rise of decentralised physical infrastructure (DePIN), one of the highest-conviction opportunities in the Web4 economy.

a. The AI Compute Supercycle

Global AI spending is forecast to reach $2.53 trillion in 2026, a 44% increase year-over-year, with AI infrastructure (servers, data centers, power, and cooling) accounting for over half of that spend. Demand is outstripping centralized supply at an alarming rate. Hyperscalers are constrained by power availability, grid limitations, and capital intensity, creating chronic shortages and escalating costs for enterprises and developers.

Gartner, "Worldwide AI Spending Forecast, 2026" (January 15, 2026).

b. The DePIN Revolution

Decentralized Physical Infrastructure Networks are emerging as the logical counterforce. According to the World Economic Forum, the DePIN sector is projected to grow from roughly $30–50 billion today to $3.5 trillion by 2028. This represents one of the fastest and largest infrastructure shifts in history, moving value from centralized monopolies to distributed, token-incentivized networks.

Source:WEF

c. Massive Structural Tailwinds

- Sovereign AI Demand: Governments, enterprises, and institutions increasingly require censorship-resistant, geographically distributed, and sovereign compute capacity.
- Green & Efficiency Pressure: The environmental and capital cost of traditional data center buildouts is becoming unsustainable.

- Edge & Hardware Abundance: Billions of underutilized devices (PCs, laptops, smartphones, IoT, enterprise fleets, and future vehicles) represent an enormous latent supply that WeNode is uniquely designed to activate.

WeNode does not compete solely on speculation. It captures real revenue in a hybrid model while offering tokenomics-driven upside in a market hungry for accessible, cost-effective, and sovereign alternatives to hyperscalers.

By combining proprietary AI intelligence, radical ease of use, and powerful viral mechanics, WeNode is built to capture a meaningful share of this multi-trillion-dollar opportunity, delivering both utility and asymmetric growth potential for the network and its participants.

5. Technology & Product

WeNode delivers a next-generation compute platform that combines cutting-edge technology with radical simplicity and true decentralisation.

a. Core Technology Stack

Proprietary AI Orchestration Engine

At the heart of the network is WeNode ‘s advanced AI orchestration layer, purpose-built to intelligently route, optimise, and verify workloads across the global mesh in real time. It evaluates latency, hardware suitability, energy efficiency, cost, and trust metrics to maximise performance and reliability.

This intelligent coordination layer is a core competitive advantage, enabling the network to continuously improve utilisation and deliver results that fragmented traditional systems cannot match at planetary scale.

b. Zero-Trust Execution Environment

All workloads run in secure, ephemeral environments using WASM and lightweight micro-VMs. Computations are RAM-only with no persistent storage of user data on nodes. Cryptographic verification and redundant execution ensure deterministic, tamper-proof results.

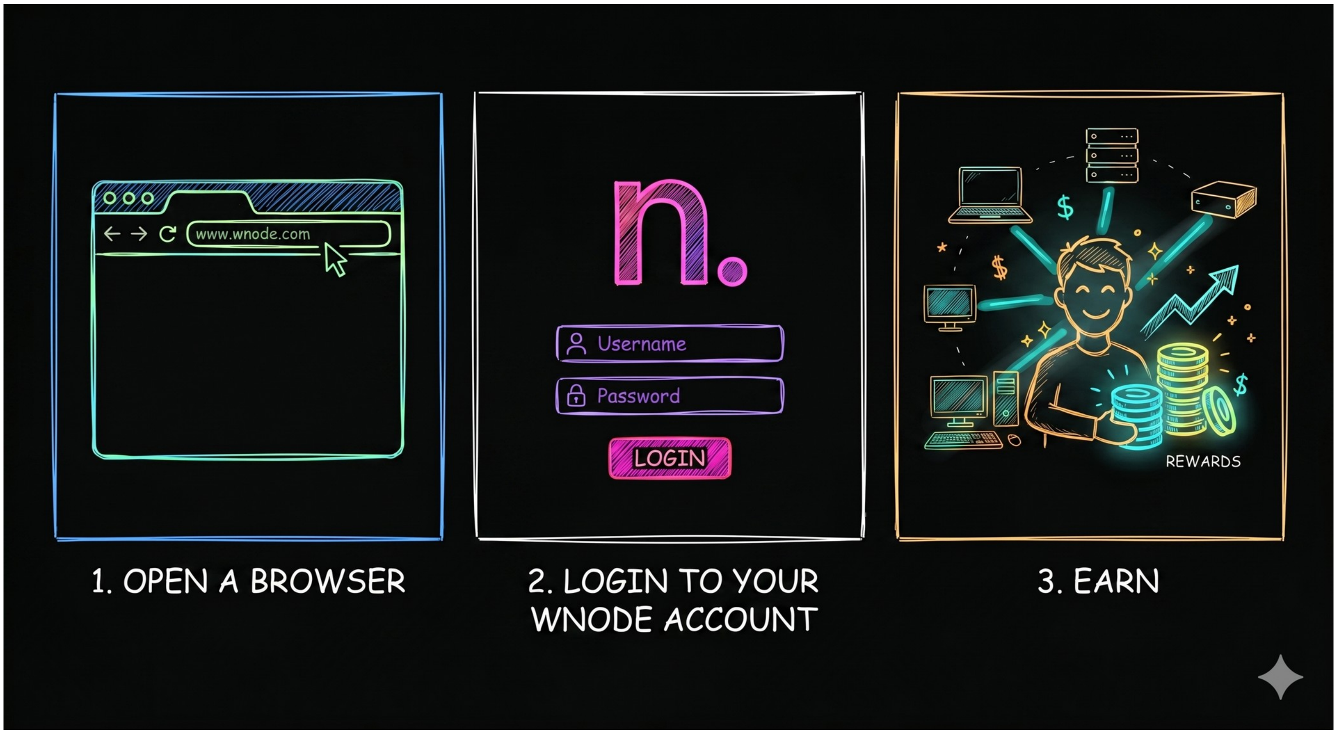
c. Multi-Tier Node Architecture

WeNode supports multiple node classes, from lightweight consumer devices and edge/IoT hardware to high-performance enterprise clusters, all unified under a single developer-friendly API. This flexibility maximises participation and global compute density.

d. Key Product Advantages

3-Click Onboarding

Anyone can become a node operator in seconds with our dead-simple desktop, browser, or edge client. No complex setup, no deep technical knowledge required, true mass accessibility.



e. Sovereignty & Vertical Integration

WeNode controls its core coordination layer, orchestration intelligence, and critical infrastructure components. This vertical integration delivers maximum resilience, reduced counterparty risk, and genuine user sovereignty over compute resources.

f. Whale-Proof & Sybil-Resistant Design

Built with gold-standard governance mechanisms that protect against capture by large holders while maintaining fair participation for all node operators.

g. Green-First Architecture

By leveraging existing idle hardware instead of building new data centers, WeNode achieves significantly lower energy consumption and carbon footprint than traditional hyperscale infrastructure.

h. Compute buyer Experience

Enterprises,developers and compute buyers get a simple, low cost, reliable, pay-as-you-go compute marketplace with fiat billing options, competitive pricing, and global distribution, all backed by enterprise-grade security and SLAs.

As well as being decentralised compute, WeNode is a fully integrated, AI-native infrastructure platform engineered for real-world adoption at planetary scale.

6. Tokenomics & Economic Model

WeNode is engineered as a true hybrid fiat/crypto infrastructure business that blends stable real-world revenue with powerful token-driven incentives.

a. Hybrid Fiat-First Revenue Model

- Clients purchase compute resources primarily in stable fiat currencies.
- Node operators receive this revenue directly in fiat, creating sustainable income that is largely protected from crypto volatility.
- This structure provides regulatory friendliness and operational stability while anchoring the network in genuine utility.
- Money, payments in and out, KYC and AML are handled by Stripe connect allowing Wenode to scale quickly without friction.

b. **WEX** Staking Mechanics

Staking Purpose (Core): **WEX** staking is designed to signal reliability and alignment, not to control governance or extract rent from the network.

c. Reliability & Service Priority

- Operators and partners can stake **WEX** to signal long-term commitment and reliability.
- Higher reliability scores (including staking, uptime, and performance) can be used to prioritise nodes for certain workloads, *without* guaranteeing work or creating a pay-to-win system.
- Staking is one input into a broader trust and performance model, not the only one.

d. Performance-Linked Incentives

- Staked participants (operators or partners) can receive performance-based bonuses when:
    - their nodes consistently meet or exceed SLA targets, or
    - the network as a whole hits utilisation or stability milestones.
    - Rewards are tied to real network performance, not passive yield or inflation.

e. No Governance Power from Staking

- Staking **WEX** does not grant governance rights.
- Governance is human-based: 1 Soul = 1 Vote, independent of token balance.
- There are no whale voting boosts, no token-weighted proposals, and no plutocratic control via staking.

f. No Inflationary Staking Rewards

- There is no infinite emission schedule and no “APY farming”.
- Total supply is fixed at 10,000,000 **WEX** .
- Any staking-linked rewards must come from real economic activity (e.g., margins, fees, or explicitly allocated pools), not from printing new tokens.

g. Alignment, Not Extraction

- Staking exists to align operators and partners with the long-term health of the mesh, not to turn Wenode into a yield product.
- The primary economic engine remains fiat-based revenue flowing to node operators, affiliates, and the Steward.

h. **WEX** Value Accrual

Value accrual in **WEX** and Wenode is driven by real network usage, not dividends or inflation. As compute demand grows, the network captures more fiat revenue, node operators earn more, and **WEX** becomes more useful as a *utility asset* within the ecosystem.

Utility-Driven Demand (Not Speculation)

Demand for **WEX** increases as the network scales because the token is used for:

- Staking for reliability (operators and partners signal long-term commitment)
- Performance-based incentives (bonuses tied to real compute output)
- Partner integrations
- Ecosystem alignment

No Inflation, No Yield Farming, No Governance Power

WEX has a fixed supply of 10,000,000 with:

- No inflation
- No artificial APYs

- No token-weighted governance
- No whale capture

This keeps the token clean, scarce, and utility-driven.

Real Economic Activity → Token Gravity

As more compute flows through the mesh:

- More operators stake for reliability
- More partners stake for alignment
- More performance bonuses are distributed
- More integrations require **WEX** for access or incentives

This creates organic, usage-linked value accrual, not speculative hype.

The Hybrid Engine: Fiat Stability + Token Upside

WeNode's edge is the combination of:

- Stable fiat cash flow for operators and enterprise clients
- A finite-supply utility token that captures upside from network growth

This avoids the pitfalls of DeFi tokenomics while still enabling a powerful, aligned economic flywheel.

7. Growth Strategy & Viral Flywheel

WeNode is not relying on traditional marketing spend to scale. Instead, we have engineered a powerful, self-reinforcing viral growth engine that turns every participant into a highly motivated node operator, affiliate recruiter and if they choose, compute sales source with lifetime revenue.

a. Viral Affiliate Growth System

At the core of our go-to-market strategy is a transparent, immutable multi-level affiliate program:

- Node operators earn ongoing commission overrides from the Affiliates they personally bring into the network (Level 1). This pays an override of 3%
- Additional rewards extend to Level 2 referrals, creating strong incentives for active recruitment. This pays an incentive boosting override of 7%
- Being a “Sales Solurce” delivers a lifelong 10% commission on all revenue from buyers linked to the Nodlrs (Node Operators) WUID (Wnode Universal ID)

This structure transforms supply-side growth into a direct revenue opportunity for participants, driving exponential hardware growth and onboarding new providers and clients at near-zero customer acquisition cost.

b. Community-Powered Flywheel

- More nodes → Better global coverage, lower latency, and stronger pricing
- Better performance → Increased enterprise and developer demand
- Higher utilization → Greater fiat revenue and token incentives
- Stronger rewards → More operators join and recruit aggressively

The result is a virtuous cycle that compounds faster than traditional cloud providers can match through capital expenditure alone.

c. Strategic Partnerships

In parallel to organic growth, WeNode is activating high-impact partnerships with the 6 pre-allocated global compute partners (IoT ecosystems, device manufacturers, enterprise fleets, and edge hardware providers). These relationships provide immediate access to large volumes of underutilised high power hardware and accelerate network density from day one. This protocol also hands partners new previously untapped connectivity advantages and mortises their products in dynamic new ways which can be used to subsidize product cost.

d. Mass Accessibility Advantage

With 3-click onboarding, WeNode lowers the barrier to entry dramatically compared to other DePIN projects. This simplicity, combined with fiat payouts and strong affiliate incentives, positions the network for mainstream adoption, not just crypto-native users.

WeNode offers such partners a mass scale zero friction adoption process. Our "Node Operator" app can be deployed OTA to their current and future device coverage.

WeNode's growth model is deliberately designed for speed and defensibility: community ownership, economic alignment, and viral mechanics create a powerful moat that is extremely difficult for centralised competitors to replicate.

8. Founder Slots Opportunity

WeNode has created an exclusive and constitutionally limited Founder Slot program to attract a limited number of high value investors who wish to have a muti-leveraged return opportunity along with a Governance Board position, and to strategically bootstrap the highest-quality compute supply to accelerate network dominance.

a. Strictly Limited to 10 Founder Slots Total

- 6 Slots are allocated for selected global partners (To be appointed). These are established players with massive untapped or underutilised compute resources across consumer devices, IoT ecosystems, enterprise fleets, smart hardware, and edge infrastructure. These will partnerships bring immediate scale and global reach.

- Up to 3 High-Value Slots remain available for strategic investors and partners who want to actively participate at the foundational level and leverage the benefit of an organically growing affiliate tree with 3 substantial permanent revenue streams.

These Founder Slots represent one of the most asymmetric early opportunities in the project. Holders gain privileged positioning, enhanced economics, and direct influence as the network scales. They are designed for those who understand the massive leverage of securing a key position in a network that aims to challenge hyperscalers and disrupt emerging compute marketplaces, including models like Tesla's plans to monetize idle compute from vehicles and robots.

This is not a passive investment. Founder Slot participants become integral to the mesh, benefiting from early network effects, boosted incentives, and the potential to co-build one of the most important infrastructure layers of the AI era.

Due to extreme scarcity and high strategic value, these slots are expected to fill quickly. They are reserved exclusively for aligned investments partners (up to 3) and strategic device partners (6) who bring meaningful compute resources, distribution power, and enterprise relationships.

9. Why WeNode Wins - Summary

WeNode wins because it delivers what the AI era demands and what no competitor, centralised or decentralised, can match in one package, an AI-native orchestration, sovereign architecture, radical accessibility, and a hybrid economic engine grounded in real revenue.

a. AI-Native, Not Blockchain-Native

WeNode's recursive AI orchestration routes, verifies, and optimizes workloads in real time whilst competitors mostly rely on static schedulers and legacy coordination layers. This gives WeNode advantageous performance, efficiency, and reliability at global scale.

c. Activating the World's Idle Hardware

Hyperscalers build more data centers. Other DePINs rent GPUs. WeNode activates existing underutilized compute across consumer devices, enterprise fleets, IoT, and future vehicles.

This creates massive supply at near-zero cost and a green-first footprint no one else can replicate.

c. Hybrid Fiat/Crypto Engine

Compute buyers pay in fiat. Node operators earn in fiat. **WEX** remains a fixed-supply utility token with no inflation, no APY farming, and no governance power. This model is regulator-friendly, enterprise-ready, and economically sustainable, a moat competitors cannot easily rebuild.

d. 3-Click Onboarding = Mass Adoption

No wallets. No GPU setup. No technical friction. Anyone can become a node operator in seconds. This unlocks billions of devices and drives adoption far beyond crypto-native audiences.

e. Viral Growth Engine

A highly respected and adopted bi-level affiliate system turns every node operator into a recruiter and sales source.
This creates a self-reinforcing flywheel:

- More nodes → better coverage
- Better coverage → more enterprise demand
- More demand → more fiat revenue
- More revenue → more incentives
- More incentives → more nodes

Hyperscalers cannot replicate this.

d. Sovereign, Vertically Integrated Architecture

WeNode owns the orchestration layer, coordination infrastructure, governance, and payment rails. This delivers censorship resistance, resilience, and true community ownership, not token-weighted plutocracy.

e. Perfect Timing

- AI compute demand is exploding.
- DePIN is entering a multi-trillion-dollar supercycle.
- Billions of devices sit idle.

WeNode sits at the exact intersection of these forces, the only model built to capture them all.

f. Competitors Cannot Catch Up

To match WeNode, a competitor would need to rebuild:

- their architecture
- their tokenomics
- their onboarding
- their governance
- their payment rails
- their growth engine

This is a multi-year reinvention. By then, WeNode will already be the dominant planetary mesh.

10. Risks & Disclaimers

While WeNode presents a compelling opportunity at the forefront of AI compute and decentralised infrastructure, prospective investors and participants should carefully consider the following risks:

Key Risks

- Technical & Execution Risk: Building a large-scale, globally distributed compute mesh involves complex challenges around network reliability, security, node up-time, and AI orchestration performance. Although mitigated through zero-trust architecture, cryptographic verification, and redundant execution, technical hurdles may delay timelines or impact service quality.

- Market Adoption Risk: The success of the network depends on attracting sufficient node supply and compute buyer demand. While the 3-click onboarding and viral affiliate system are designed for rapid growth, competing in the highly competitive cloud and DePIN sectors is inherently challenging.

- Regulatory Risk: The evolving regulatory landscape for crypto assets, DePIN projects, and tokenized incentives may impact operations, token utility, or tax treatment in various jurisdictions. WeNode’s hybrid fiat-first model is designed with compliance in mind (including AML/KYC on fiat ramps), but regulatory changes remain a material risk.

- Token Volatility & Economic Risk: The value of **WEX** may experience significant volatility. Returns are driven primarily by network adoption and tokenomics rather than guaranteed yields or dividends. There is no assurance of liquidity or appreciation.

- Competition Risk: Hyperscalers and other decentralised compute projects continue to evolve rapidly. While WeNode’s AI orchestration, accessibility, and hybrid model provide differentiation, competitive pressure could affect market share and growth.

Forward-Looking Statements

This document contains forward-looking statements regarding future performance, strategy, and market opportunity. Such statements are based on current assumptions and are subject to risks and uncertainties. Actual results may differ materially from those expressed or implied.

No Investment Advice

This memorandum is for informational purposes only and does not constitute financial, legal, or investment advice. Investors should conduct their own due diligence and consult professional advisors before making any investment decision. Participation in Founder Slots or token acquisition involves substantial risk of loss.

WeNode's team is committed to transparency, strong execution, and long-term value creation. The hybrid fiat/crypto model, vertical integration, and focus on real utility are deliberate design choices intended to mitigate many common DePIN risks.

11. One-Year Financials (Sovereign Mesh Model)

WeNode does not operate as a corporation and therefore does not produce "profit," "EBITDA," or "retained earnings." Instead, it functions as a **pure flow-through economic mesh**, where **100% of all FIAT revenue is automatically allocated** to the participants who power, grow, manage and secure the network.

This structure is not a limitation but a core competitive advantage.
It eliminates overhead, removes corporate extraction, and ensures that all economic value flows directly to:

- **NODLRs** (node operators)
- **Sales Sources**
- **Affiliate trees**
- **The Steward**
- **The Infrastructure Manager**

The DAO retains **zero profit**, by design.

This aligns with the economic law defined in the WeNode constitution: here

> "For every $1.00 entering the mesh:
> 70% → Node Operator
> 10% → Sales Source
> 10% → Affiliate Tree
> 7% → Steward
> 3% → Infrastructure Manager."

This is the immutable distribution model of the WeNode Sovereign Compute Mesh.

11.1 Network State: Year 1

The first year represents the **Expansion Phase**, where viral mechanics, 3-click onboarding, and the Sales Source engine activate rapid horizontal scaling.

Year 1 Network Metrics

Metric	Year 1 (Aggressive)
Active Nodes	**5,000**
Total FIAT Flow Through Mesh	**$18.5M**
Node Payouts (70%)	**$12.95M**
Sales Source + Affiliate Tree (20%)	**$3.7M**
Steward Allocation (7%)	**$1.295M**
Founder Override (3%)	**$555k**
DAO Retained Profit	**$0**

These figures reflect **ecosystem throughput**, not corporate revenue.
WeNode is an **economic organism**.

11.2 Interpretation of Year 1 Financials

1. Node Operator Income (70%)

The majority of all FIAT flow is paid directly to NODLRs, creating:

- real-world income
- global supply expansion
- hardware onboarding incentives
- viral recruitment (K > 1.0)

This is the engine of the mesh.

2. Sales Source + Affiliate Tree (20%)

This allocation funds:

- zero-CAC growth
- perpetual revenue for early participants
- a self-reinforcing viral loop

Every node operator becomes a recruiter, salesperson, and compute reseller.

3. Steward Allocation (7%)

The Steward is the **operational heart** of the mesh:

- governance execution
- protocol maintenance
- sovereign infrastructure

- compliance
- AI orchestration oversight

The Steward is not a profit center, it is a **service role**.

4. Founder Overide (3%)

The 10 Founder Affiliate tree positions attract a 3% override to infinity permanently. Representing a high value opportunity for early stage investors. Only 3 slots are availabe ona first come first served basis. Each position comes with a single seat on the Governance Board

5. DAO Retained Profit: $0

The DAO is not a corporation or profit aggregator. It is a **conduit through which revenue flows directly to owners and stakeholders resulting in :-**

- No corporate wealth.
- No treasury extraction.
- No financial power centre.

11.3 Investor Upside (Non-Profit Model)

Because WeNode does not retain profit, investor upside comes from **three leverage vectors**:

1. WEX Token Appreciation

WEX is a fixed-supply utility token (10,000,000 total) whose value increases as:

- network utilisation grows
- staking demand increases
- partner integrations expand
- performance incentives scale
- governance participation increases

This is **utility-driven value**, not speculation.

2. Founder Slot Economics

Founder Slots provide:

- permanent 10% Sales Source commission
- L1 + L2 overrides
- 3% of all compute sales in their tree to infinity forever
- governance board seat
- early token leverage
- extreme scarcity (only 3 slots)

This is one of the most asymmetric opportunities in the mesh.

3. NODLR Accounts

Node operators earn **real FIAT income** from compute jobs.
This is the most direct economic participation mechanism.

11.4 Why This Model Wins Financially

WeNode's financial architecture is fundamentally different from both:

- corporate cloud providers
- token-inflation DePIN projects

It wins because:

a. Zero Overhead = Maximum Competitiveness

No data centers.
No capex.
No corporate payroll.
No infrastructure burden.

b.1 00% Flow-Through = Maximum Incentive Alignment

Every participant is economically motivated.
Every dollar is accounted for.
Every role is rewarded.

c. Viral Growth = Zero CAC

The mesh pays only for successful compute jobs.
Growth is self-funding.

d. Token Value = Network Utility

No inflation.
No APY farming.
No governance power.
No dividends.

This keeps **WEX** clean, scarce, and utility-driven.

11.5 Final Summary (Year 1)

Wnode's first year establishes the Sovereign Compute Mesh as a **self-sustaining, self-funding, and self-expanding economic organism**.

- **$18.5M** flows through the mesh

- **$12.95M** goes to node operators
- **$3.7M** fuels viral growth
- **$1.295M** sustains the Steward
- **$555k** maintains sovereign infrastructure
- **$0** is retained as profit

12. Use of Funds

The $250,000 requirement will be spread across 3 raise activities starting with $80,000 by way of private sale. This raise is not traditional startup capital as the hard work is done and the MVP is online ready for Beta testers and final snagging. This initial capital is for the activation of the **Sovereign Compute Layer** that anchors the entire WeNode mesh.

As traction grows we will apply for grants :-

- peaq Foundation Grant Program
- IoTeX Halo Grants & DePIN Surf
- Solana Foundation & Superteam Grants
- BNB Chain Grants Program
- NEAR Foundation Funding
- Web3 Foundation (Polkadot Ecosystem)

Once we sign up a major tech partner we will asses our needs and either scale with the funds from the above activities or offer a second private placement.

Funds are allocated to **hard, sovereign, non-speculative infrastructure** that guarantees:

- Tier-1 reliability
- decentralised control
- censorship resistance
- independence from hyperscalers
- long-term mesh stability

Breakdown

- **Sovereign Compute (DGX / H100 class hardware)** Establishes the Tier-1 backbone for enterprise inference.
- **Sovereign Power (Solar + UPS)** Ensures uninterrupted operation independent of grid instability.
- **Sovereign Storage + Redundancy** For logs, metadata, and orchestration state.

- **Mesh Activation Infrastructure** Networking, security, and orchestration bootstrap.
- **DAO Migration & Legal Architecture** Transition of assets into the DAO Trust and moving the structure from a UK ltd company to Dubai for crypto/DAO friendly environment and Tax efficiency.
- **AI Swarm Deployment** Autonomous onboarding of global idle compute and mesh clients.
- **Founder Partner Sign-up** Travel, meeting, hotels, contracts.

Footnote - Test Deployments
The **only official token** recognized by the Wnode ecosystem is:

WEX (Wenode Utility Token) Polygon Mainnet:
0xa382506695f825fe807C3f4D47aEB986046bdc57

The following two early WNODE deployments are formally **deprecated** and not part of the Wnode economic model:

- 0xF7bB2ea845b9e56aEf9E364d6Ae05Ea88236ca40
- 0x62eFDE5D3C2318E01237eFBb7Eac35BdC7a14D53

Wnode maintains a **single canonical token** with a fixed supply of 10,000,000 WEX. No additional tokens will be created.
