

Wnode White Paper

Sovereign Compute Mesh for the Agent Economy

Version: 1.5 — June 2026

Author: Stephen Soos, Founder & Architect

1. Executive Summary

Wnode is a live sovereign compute mesh that activates idle hardware across Earth (with orbital extension planned) into a unified, permissionless execution layer purpose-built for autonomous agents and machine-to-machine economies.

The network delivers RAM-only, stateless, cryptographically verifiable compute with zero data retention. It features frictionless onboarding, fiat-first USD settlement rails, and 600+ protocol-level integrations. This creates a capital-efficient, human-friendly alternative to centralized hyperscalers and fragmented DePIN networks.

Key Highlights:

- MVP live with functional dashboards and real workload execution
- Nodes onboard in under 10 minutes
- 600+ protocol integrations with active execution hooks (Coinbase, Sui, ICP, Tether, Polygon, and others)
- Optimised for high-volume stateless micro-tasks: agent actions, verification, oracles, and sharded inference
- 70% revenue share to node operators
- Seeking \$100,000 USD to accelerate public beta and scale

Wnode turns global hardware waste into sovereign infrastructure for the emerging machine economy.

2. The Problem

Compute demand is exploding due to AI agents and autonomous systems, yet current solutions fall short:

- Centralised Cloud Limitations: High costs, opaque pricing, vendor lock-in, single points of failure, and significant environmental impact.
- Idle Hardware Waste: Consumer and enterprise devices sit idle ~75% of the time.
- DePIN Fragmentation: Most networks are vertical-specific, token-heavy, technically complex, and lack unified agent execution or regulated fiat rails.
- Lack of True Redundancy: No major network spans dense terrestrial coverage and orbital/sovereign execution.

The result is a market failing to serve the granular, high-frequency, verifiable compute needs of the agent economy.

3. Solution: The Wnode Mesh

- Wnode creates a unified, sovereign compute fabric where:
- Anyone can contribute hardware and earn in USD.
- Agents and developers can submit workloads with minimal friction.
- All execution is RAM-only, stateless, ephemeral, and cryptographically verifiable.

3.1 Core Design Principles:

- Stateless-first execution optimized for agent workloads.
- Fiat-first settlement for mass adoption.
- Permissionless and “granny-proof” onboarding.
- Sovereign AI-driven routing and orchestration.

4. Architecture

Wnode consists of heterogeneous node types (Low, Standard, Pro, Edge, Enterprise, and future Space Nodes) feeding into a distributed execution environment.

4.1 Key Technical Components:

- Sovereign AI Orchestrator: Intelligent routing engine that assigns micro-jobs based on locality, performance, reputation, real-time telemetry, and market conditions. Uses Mixture-of-Experts patterns for self-optimization.
- Execution Layer: RAM-only, encrypted, deterministic. Zero persistent storage on nodes.
- Verification Layer: Redundant execution, hash matching, deterministic replay, and cryptographic proofs.
- Security Model: Hardware fingerprinting, automatic isolation, no plaintext exposure.

This architecture excels at fast, granular workloads where persistence is unnecessary or handled externally via protocol integrations.

5. Earth Mesh & Space Mesh

Earth Mesh democratizes compute by turning everyday devices into productive nodes with zero-config setup, automatic updates, instant fiat payouts, and a viral affiliate engine.

Space Mesh (in active development) provides orbital redundancy and global coverage using satellite idle windows. Initial focus is lightweight, stateless workloads with a single partner.

5. Traction & Current Status

MVP Live: Fully operational Mesh with real workload execution and payouts.

Dashboards:

Admin: `cmd.wnode.one`

Compute Buyer: `mesh.wnode.one`

Node Operator: `nodlr.wnode.one`

Onboarding: <10 minutes for non-technical users.

Integrations: 600+ protocol-level integrations with execution hooks and live end-to-end agent settlements.

Core Loop: Proven with test stateless jobs, verification, fiat settlement.

6. Protocol-Level Integrations & Go-to-Market

Wnode's GTM leverages deep protocol integrations that allow agents to operate natively across settlement, data, and execution rails without middleware.

Current integrations include Coinbase, Sui, ICP, Tether, Polygon, and 600+ others. This creates immediate demand channels and positions Wnode as first-class infrastructure for the agent economy.

6.1 Enabled Capabilities:

- Edge inference
- Real-time oracles
- Autonomous trading, hedging, and settlement
- Headless M2M coordination

7. Tokenomics & Revenue Model

WNODE (WEX) serves as a utility token for governance, staking, incentives, and ecosystem growth. Primary compute payments remain USD-first for regulatory simplicity and broad adoption.

Revenue Distribution (Gross Mesh Revenue):

- Node Operators: 70%
- Sales Source: 10%
- L1 Affiliate: 3%
- L2 Affiliate: 7%
- Wnode Ltd (Steward): 7%
- Founder Override: 3%

The model is highly capital-efficient with near-zero infrastructure costs.

8. Governance & DAO

Wnode features a capture-resistant, soul-based DAO with 1 Soul = 1 Vote. A formal Constitution provides immutable safeguards. Wnode Ltd acts as the regulated operational Steward with no control over governance or treasury.

9. Environmental Impact

Wnode is one of the most environmentally neutral compute networks: no new datacenters, no new hardware manufacturing, minimal resource use, and future solar-powered orbital capacity. It converts idle hardware waste into value.

10. About the Founder

Stephen Soos is the founder, architect, and sole developer of Wnode.

Stephen built the platform under extreme adversity. After four years under martial law in Ukraine, he and his family fled in early 2026 with minimal possessions. Using scavenged “potato stack” hardware while rebuilding life in Hungary, he developed the initial Mesh working extended hours daily.

With decades of experience, including early ecommerce, Xerox cloud-connected printing systems, medical hardware ecosystems, and scaling a 12-clinic network treating 30,000+ patients, Wnode represents the culmination of his expertise in systems architecture, AI orchestration, and decentralised governance.

11. Investment Opportunity & Roadmap

Wnode is raising \$100,000 USD to accelerate public beta, deepen high-volume integrations, eacquire sovereign tech stack, and reach initial recurring revenue.

12. Key Milestones:

- Public beta launch (Q3 2026)
- Rapid node activation via viral engine
- Production-grade rails and enterprise pilots
- First Space Mesh partner pilot

13. Financial Projections (Conservative, Annualised Gross Revenue):

- Beta Launch (0–6 months): \$100k – \$400k
- Early Scale (7–12 months): \$1.2M – \$3.5M
- Growth Phase (13–24 months): \$8M – \$25M

All funds go directly to product and infrastructure. Founder takes zero salary.

14. Risks & Mitigations

- Node reliability: Addressed through reputation scoring, verification, and redundant execution.
- Integration scaling: Leverages existing 600+ hooks.
- Regulatory: USD-first model and compliant Steward structure.
- Competition: Focused differentiation on agent-optimized stateless execution and fiat accessibility.
