

Financial Statement - Executive Summary

Wnode operates not as a company, but as a **Sovereign Compute Mesh**, a DAO-governed, self-sustaining economic organism coordinating global AI inference. Wnode abandons the legacy corporate model of “profit,” “retained earnings,” and “runway,” replacing it with a **100% flow-through revenue architecture** where every dollar is pre-allocated to the participants who power and grow the mesh.

With sovereign hardware, sovereign power, and AI-automated operations, Wnode achieves a **zero-overhead structure** where growth is viral, self-funding, and incentive-driven. Investors do not buy equity; they acquire **economic participation rights** through token leverage, early NODLR accounts, and optional Steward licenses, positioning themselves inside the economic bloodstream of the 2026 AI inference economy.

Market Demand Analysis (2026 Context)

The global economy has shifted decisively to **Inference-as-a-Service**. Autonomous agents, edge devices, and real-time AI workloads dominate compute demand.

- **TAM:** Global AI inference demand projected at **\$1.8T** by end-2026.
- **Structural Shift:** From centralized training → decentralized edge execution (T4/T5).
- **Wnode Advantage:** 30–50% cheaper than cloud incumbents due to:
 - zero overhead
 - sovereign power
 - sovereign hardware
 - DAO-based economic distribution

Wnode captures the “Inference Gap” that hyperscalers cannot serve efficiently.

Pricing Benchmark Table (5 Tiers)

Tier	Hardware Type	Use Case	Wnode FIAT Price	Utility Multiplier
T1: Enterprise	DGX / H100 / B200	High-priority LLM inference	\$2.40/hr	5.0×
T2: Mid-range	A100 / L40S	Batch inference	\$1.10/hr	2.5×

Tier	Hardware Type	Use Case	Wnode FIAT Price	Utility Multiplier
T3: Consumer	RTX 4090 / 3090	Image/video generation	\$0.45/hr	1.2×
T4: Edge	Jetson / ARMGenerating	IoT / robotics	\$0.08/hr	0.8×
T5: Mass IoT	Mobile / Smart TV	Micro-inference	\$0.005/hr	0.1×

This is critical:

Wnode captures **all compute**, not just high-end GPUs.

This is the core differentiator.

Network-Centric Revenue Model (3 Scenarios)

(Tracks Total Ecosystem Throughput , not profit)

Scenario	Network State	Active Nodes	Annual Revenue Flow
Genesis	Sovereign Anchor	100	\$1.2M
Expansion	Viral Growth	5,000	\$18.5M
Hyper-Mesh	Global DePIN Layer	50,000+	\$145M

This is **the mesh's total FIAT flow**.

Viral Growth Model

Growth is driven by the **Viral Coefficient (K)** where every node operator is also:

- a salesperson
- an affiliate
- a compute reseller

Target:

K = 1.3 (each node brings in 1.3 more nodes/customers)

Zero CAC:

Acquisition is funded by the **10% Sales Source** and **10% Affiliate** allocations.

The mesh only pays for successful compute jobs.

Node Supply Model

Wnode's supply is elastic and self-funding:

1. **Sovereign Anchor:**

The DAO-owned DGX stacks provide Tier-1 reliability.

2. **Community Mesh:**

Operators contribute T2-T4 hardware to earn the 70% revenue share.

3. **Autonomous Onboarding:**

AI swarms identify underutilized compute globally and offer instant integration.

This is **infinite horizontal scaling** with no corporate overhead.

Tokenomics Value Model

WNODE derives value from **network utility**, not speculation.

- **Utility:**

Used for staking (optional), reward multipliers, and access tiers.

- **Treasury Growth:**

Driven by token value appreciation and node licensing fees, not profit.

- **Network Effect:**

As utilisation increases, demand for staking increases, reducing circulating supply without reflexive speculation loops.

There are **no forced buybacks, no burns, no BME mechanics** unless the DAO votes for them later.

3-Year Network Projection Table

Metric	Year 2	Year 3
Total FIAT Flow	\$12M	\$85M
Node Payouts (70%)	\$8.4M	\$59.5M
Sales/Affiliates (20%)	\$2.4M	\$17M
Steward (7%)	\$840k	\$5.95M
IM (3%)	\$360k	\$2.55M
Retained Profit	\$0	\$0

This is **exactly correct**.

Wnode retains **nothing**.

The mesh is a **pure flow-through economy**.

Unit Economics per Tier

For every \$1.00 entering the mesh:

- **\$0.70** → Node operator
- **\$0.10** → Sales source
- **\$0.10** → Affiliate tree
- **\$0.07** → Steward
- **\$0.03** → Infrastructure Manager

This is the **immutable economic law** of the mesh.

Sensitivity Analysis

Variable	Change	Impact
Utilisation	-20%	Reduces payouts proportionally; DAO remains stable.
GPU Market Price	-50%	Wnode remains competitive due to zero overhead.
Token Volatility	High	No impact on FIAT operations; affects reward multipliers only.

\$250k Raise Justification (DAO-Based)

The \$250k raise is **not seed capital**.

It is the **Genesis Sovereignty Layer**.

It funds:

- **Sovereign Compute** (DGX)
- **Sovereign Power** (solar)
- **Sovereign Storage + UPS**
- **Mesh Activation**
- **DAO migration**
- **AI swarm deployment**

Investors gain:

- early token leverage

- early Founder NODLR accounts (3 available to high value first come first served)
- early NODLR accounts
- optional Steward license

This is **economic participation**, not equity.

DAO Migration Plan

1. **Phase 1:** Temporary Wnode Co. acquires hardware + solar.
2. **Phase 2:** Assets transferred to DAO Trust in a tax-neutral jurisdiction.
3. **Phase 3:** Economic rights encoded in smart contracts; Steward + IM become DAO-elected roles.

Final Analyst Note

Wnode is not a traditional industrial era business.

It is a **self-sustaining economic organism**.
